Our goal when opening the new state-of-the-art manufacturing facilities for Sloanebuilt was to ensure our customers were receiving better than best service and products and that our staff could deliver this with better than best machinery and equipment. Our onsite Plasma cutter does just this.

Our customers benefit from quicker build times and lower costs thanks to the quicker cut times, more precise workmanship, and near-perfect micro-burr free cutting results. Our Plasma cutter helps our customer get their products at a quicker rate, for a lower cost and a more refined finish to outlast competitors.

Our first class specialist tradesmen also benefit working with the most advanced machinery to get precise cuts on mild steel, stainless steel, and aluminium up to a whopping 10,000mm long, 2,500mm wide and 50mm thick meaning they can get more work done in a shorter space of time often by cutting multiple items in one run. Our Plasma cutter is one of the most diverse pieces of equipment under the big roof, allowing us to produce parts for our custom trailers but also allows us to create post-cutting processes, including bending, drilling, wash grinding, stress relieving, and bevelling.

The software used by this cutter also permits our customers and our speciality tradesmen to view the finished product prior to cuts commencing and make any changes if necessary, by our onsite skilled engineering team.

Our Plasma cutter, skilled trades and software are all onsite providing reliable and consistent accuracy, which further reduces lead times for our customers to receive their finished Australian Made quality product.

*The plasma cutter allows us to service other industries as well including mining, agriculture, and aerospace businesses with custom cuts for items such as industry specific machinery, equipment, and vehicles.*
